The Leadership Qualities New Managers Should Adopt First

Leadership - 20 July 2026 - By Dr. Amitabh Kumar

Why the first qualities you build matter disproportionately

Most new managers are promoted because they were excellent individual contributors, not because they have already demonstrated leadership ability. The qualities that made someone a strong performer, technical skill, speed, personal output, are rarely the ones that make them a strong manager. The habits a new manager builds in the first months tend to set a pattern that is hard to unlearn later, which makes it worth being deliberate early rather than simply reacting to whatever comes up first.

Self-awareness, before anything else

New managers who do not understand their own default tendencies under pressure, toward control, toward conflict avoidance, toward over-explaining, tend to repeat the same unexamined pattern across every situation rather than adapting to what each one actually needs. Daniel Goleman's work on emotional intelligence, particularly his 1998 Harvard Business Review article "What Makes a Leader," remains one of the clearest practical starting points, distinguishing self-awareness, self-regulation, motivation, empathy and social skill as the core components worth developing in sequence, since self-awareness underpins the rest. A simple, concrete tool: after a difficult interaction, write down what you felt, what you did, and what you would do differently, a habit sometimes called an after-action review, borrowed from military and clinical training contexts.

Clarity in delegation and expectations

New managers frequently under-delegate, either doing the work themselves or handing over tasks with unclear expectations, then being surprised by the result. Stephen Covey's work in The 7 Habits of Highly Effective People popularised the idea of clarifying desired outcomes before handing over a task, sometimes summarised as beginning with the end in mind. A practical tool worth adopting early is a brief delegation checklist covering outcome, boundaries, resources, and check-in points, agreed explicitly before work begins rather than assumed.

The ability to have direct, respectful conversations

Many new managers avoid necessary feedback conversations out of discomfort, which tends to allow small issues to grow. Kim Scott's Radical Candor offers a widely used framework built on two axes: caring personally and challenging directly, arguing that leaders need both at once, since challenge without care reads as aggression, and care without challenge becomes what Scott calls ruinous empathy, where problems go unaddressed out of a misplaced desire to be liked.

Situational flexibility, not a single fixed style

New managers often default to a single leadership style, usually either highly directive or highly

hands-off, based on their natural preference, applied uniformly regardless of the person or task. The Situational Leadership model developed by Paul Hersey and Ken Blanchard offers a more precise alternative, matching the level of direction and support to a given person's competence and confidence for a specific task, a distinction explored further in a companion article on this site.

Listening before advising

A strong early habit is resisting the urge to immediately solve every problem a team member brings, and instead asking what they have already considered. This coaching-style approach, widely associated with the GROW model developed by Sir John Whitmore in Coaching for Performance, builds team capability over time rather than creating dependence on the manager for every decision.

A grounded starting point

New managers do not need to master every leadership theory at once. Building genuine self-awareness, clear delegation habits, the willingness to have direct conversations, situational flexibility, and a listening-first instinct, in roughly that order, gives a solid, well-evidenced foundation to build the rest of a leadership career on.
